SLOW WILLIE

Slow Willie is a dry, powdered concrete delay set product conveniently packaged in easy-to-use 1 lb. bags. It's easily mixed in with concrete during the placing operation giving the operator greater control during a pour with set up time. This must-have concrete retarder saves you money and time. Delaying the setting time allows the operator time to reach proper clean-out locations. This pre-packaged delay set works well with any mix and will not affect structural concrete strength. Use one bag to delay one yard of concrete for up to 3 hours.

FEATURES & BENEFITS

SIMPLE No pre-mixing is required, and it delays concrete set for up to three hours

SAFE Has no long-term impact on concrete

ECONOMICAL Needs minimal expense

CHEAP INSURANCE Alleviates thousands of dollars in downtime and broken equipment

INCREASED FLEXIBILITY Allows operator time to reach a proper clean-out location

INSTRUCTIONS

- 1 A 1-lb. bag of Slow Willie added to 1 cubic yard of concrete will delay setup for up to three hours, based on the use of a standard concrete hopper and 5-inch diameter lines. For 32-meter booms and smaller- use one bag. For larger than 32-meter booms - use two bags. For line pumps with large lines (5" diameter) use one bag for each 100 feet of system. For small lines (less than 5" diameter) use one bag for each 200 feet of system.
- 2 After adding Slow Willie the mix, agitate at high speed for five minutes. If concrete is in the pump system, put the tip hose over the hopper and re-circulate so that Slow Willie is completely mixed with all concrete in the system and hopper.
- 3 If the concrete mix treated with Slow Willie is to be used sooner than planned, add fresh concrete or concrete accelerators.
- 4 If it is to be used later than planned and the mix has not returned to its original slump, simply add more Slow Willie.
